

Unique Two-Way Communication For Communal & District Heating Systems

The Evinox Modusat® heat interface unit, with integrated energy meter, accurately records each individual's energy consumption in an Evinox communal heating system.

Evinox SmartTalk® technology goes even further. Using two-way data communication, the system in each dwelling can be remotely metered, controlled, interrogated and tested.

Our Modusat® software has the ability to not only download data from the unit but to also upload data to provide control remotely.

SmartTalk® two way control system provides a number of important benefits:-

- The system in each apartment can be fully controlled remotely, including timings and settings, and provides remote diagnostic capability and client support.
- Fault alarms can be checked by testing the operation of components.
- Avoids unnecessary call-outs as a result of user error.
- Data logging of apartment temperatures.
- Empty apartments can be monitored and controlled without the need to visit site for example un-sold or un-let properties can be left on frost protection and if the unit is sold or let or simply has a viewing then the heating can be turned on from the management office.
